

OOP Final Project

Class Group: G11

Team name: G2

**Team Members: Frolov Yevgeniy, Asset
Yeshenbay, Kerimkul Kurbanbek**

Project Theme and what we have done so far

We were doing console application which imitates University system behaviour and inner side.

We made fully working authentication

We made working app with connection to db and basic functional.

```
You are connected!
=====
Research-Oriented University System
Console Demo
=====
Welcome! Press x to stop
Login: 
```

```
public class UDBM {
    Connection conn;
    public UDBM(){
        try {
            this.conn = DriverManager.getConnection(
                "jdbc:postgresql://localhost:5432/rodb",
                "postgres",
                "Horse"
            );
        } catch (Exception e) {
            e.printStackTrace();
            System.out.println("Connection failed");
        }
    }
    static{
        System.out.println("You are connected!");
    }
}
```

There are quite a lot of functions possible, especially for admin/manager(24 for them and 10 on average for others)

```

Welcome! Press x to stop
Login: John
Password: Horse
Login successful!
Hello, John Welcome to University system, please, choose an action available for you:
Please, select the command
1. Exit
2. Register new manager
3. Register new admin
4. Register new teacher
5. Register new student
6. Register new researcher
7. Register new course
8. Assign head lector
9. Assign teacher to course
10. Register student to course
11. Create lesson
12. Assign supervisor
13. Print all users
14. Print all courses
```

What functions are fully working:

Those are functions of admin/manager(we combined them)

All of this is working for student

```

Login successful!
Hello, student_aidar Welcome to University system, please, choose an action available for you:
Please, select the command
1. Exit
2. Print all courses
3. Sign up for a course
4. Print marks
5. Print all courses
6. Print your classes
7. Print lessons
8. Print Marks by Course
9. Become Researcher
10. Join research project
11. Start research project
12. Create research paper
13. View news
14. View news by author
15. Close console
Enter your command: █
```

```
Hello, John Welcome to University system, please, choose an action available for you:
Please, select the command
1. Exit
2. Register new manager
3. Register new admin
4. Register new teacher
5. Register new student
6. Register new researcher
7. Register new course
8. Assign head lector
9. Assign teacher to course
10. Register student to course
11. Create lesson
12. Assign supervisor
13. Print all users
14. Print all courses
15. Print all papers
16. Print top cited researcher
17. Create research project
18. Make request
19. Get own requests
20. Get received requests
21. Add news
22. Print all employees
23. Set attendance
24. View news
25. View news by author
26. Close console
```

Researcher functions are also shown here, in student and teacher scenario(there is still separate class for them)

```
Hello, teacher_arman Welcome to University system, please, choose an action available for you:
Please, select the command
1. Exit
2. Put mark
3. Print marks report
4. Print all courses
5. Print marks for course
6. Set attendance
7. Become Researcher
8. Join research project
9. Start research project
10. Create research paper
11. Make request
12. Get own requests
13. Get received requests
14. View news
15. View news by author
16. Close console
```

What we haven't done by deadline:

			Marks
We couldn't make few important function for real case scenario such as: User logs(they are easily implemented due to our architecture, but we hadn't time)	Real Requests: Our requests now are just some kind of messages, not "promises" which are on way to be allowed and performed	Prerequisites system: Our system currently doesn't support prerequisites, and there will be issues with implementing them in future, but it's possible	automatization: In ideal situation, mark should some own parts by itself, currently, it's manual work

Thank You For Attention!
